

Microbial products – failure in field?

Example of mycorrhizal fungi

Christel Baum
Soil Biology, University of Rostock

The problem

Author: C. Felgentreu

Arbuscular mycorrhiza formation

Arbuscular mycorrhiza
(fine root of *Zea mays*)

Spores of AMF (\varnothing 180-320 μm)

- mutualistic symbiosis of the majority of crop plants
- fungal partners: obligate symbionts, belonging to the phylum Glomeromycota

Most common fungal genera:

- *Acaulospora*
- *Diversispora*
- *Scutellospora*
- *Glomus*
- *Funneliformis*
- *Rhizoglomus*

Mycorrhizal host plants in arable use

Botanic family	Crop name	Species
Fabaceae	Soya bean	<i>Glycine max</i> (L.) Merr.
	Red clover	<i>Trifolium pratense</i> L.
	Faba bean	<i>Vicia faba</i> L.
Linaceae	Flax	<i>Linum usitatissimum</i> L.
Poaceae	Oat	<i>Avena sativa</i> L.
	Millet	<i>Pennisetum glaucum</i> (L.) R.Br.
	Rye	<i>Secale cereale</i> L.
	Barley	<i>Hordeum vulgare</i> L.
	Wheat	<i>Triticum durum</i> Desf.
	Corn	<i>Zea mays</i> L.
Solanaceae	Potato	<i>Solanum tuberosum</i> L.

mod. Martín-Robles et al. (2017) *New Phytologist*, 218, Issue: 1, Pages: 322-334, DOI: (10.1111/nph.14962)

Benefits of mycorrhiza formation

Plant nutrition:

- Improved supply of P, N, Zn and water

Plant protection:

- Increased stress tolerance
- Induced resistance against pathogens

Soil fertility:

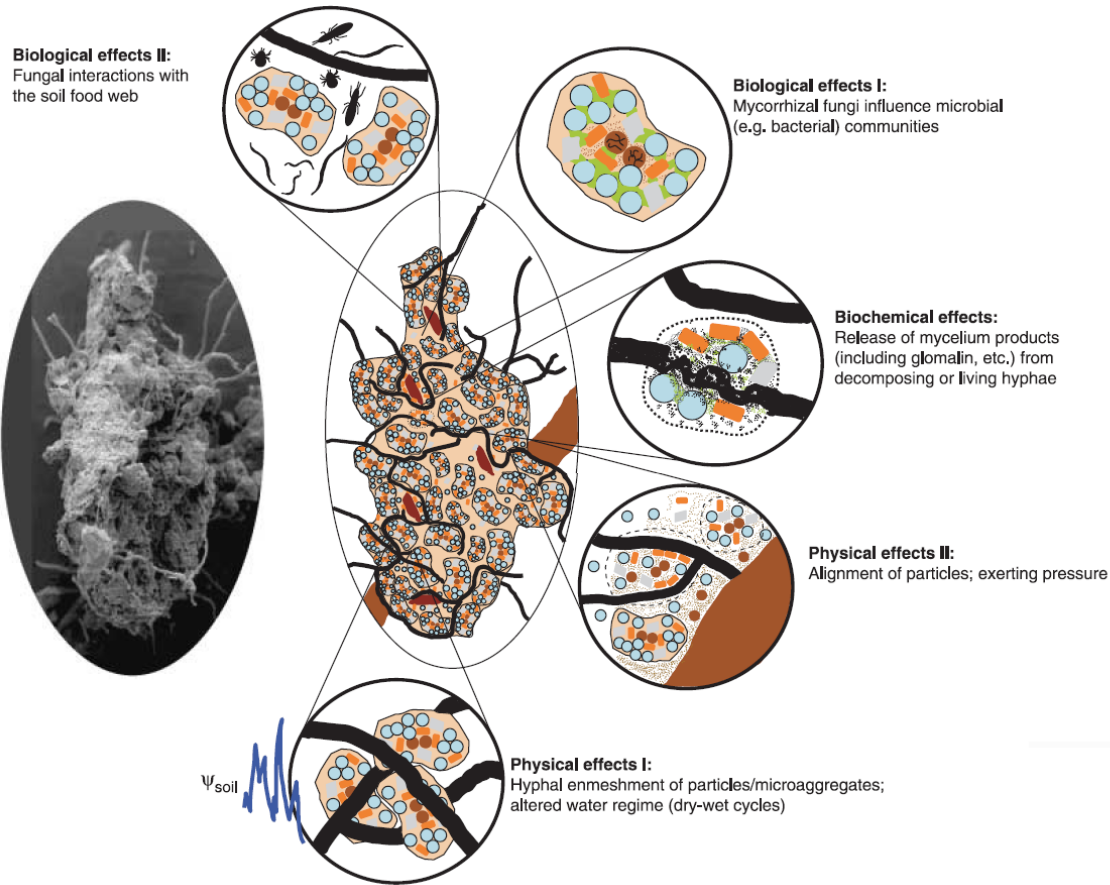

- Increased aggregate stability
- Decreased erosion
- Improved vertical nutrient transfer from sub- to topsoil
- Labile nutrient storage

The mycorrhizosphere

increased
catchement area
for nutrients and
water

Soil ecological significance

Microaggregates 53–250 μm

Particulate organic matter

Microaggregates <53 μm

Fungal hyphae

Clay

Root exudates

Silt/sand

Mycelium products

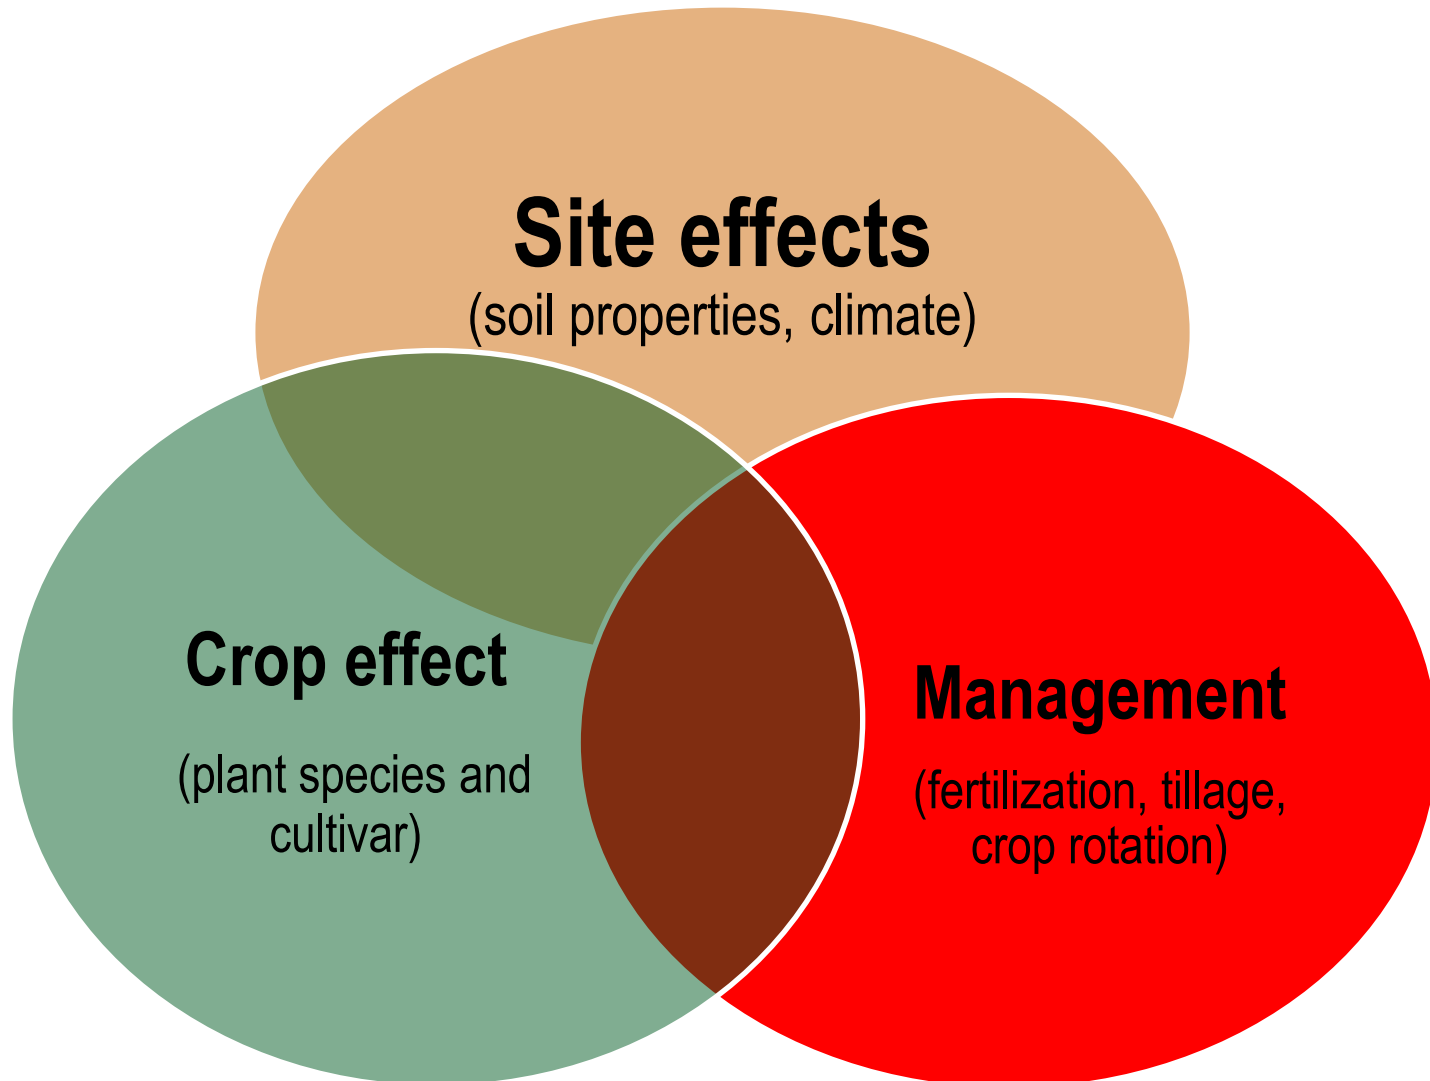

Rillig und Mummey (2006)

Impacts of domestication

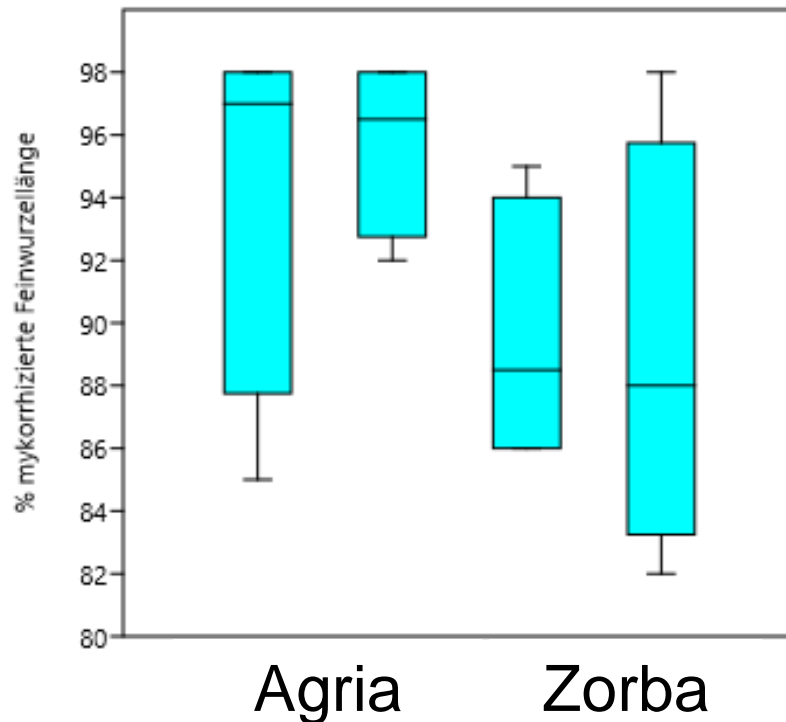

Martin-Robles et al. (2017) *New Phytologist*, DOI: 10.1111/nph.14962

Controls of mycorrhiza formation

Mycorrhiza formation (potato)

Baum (2023)

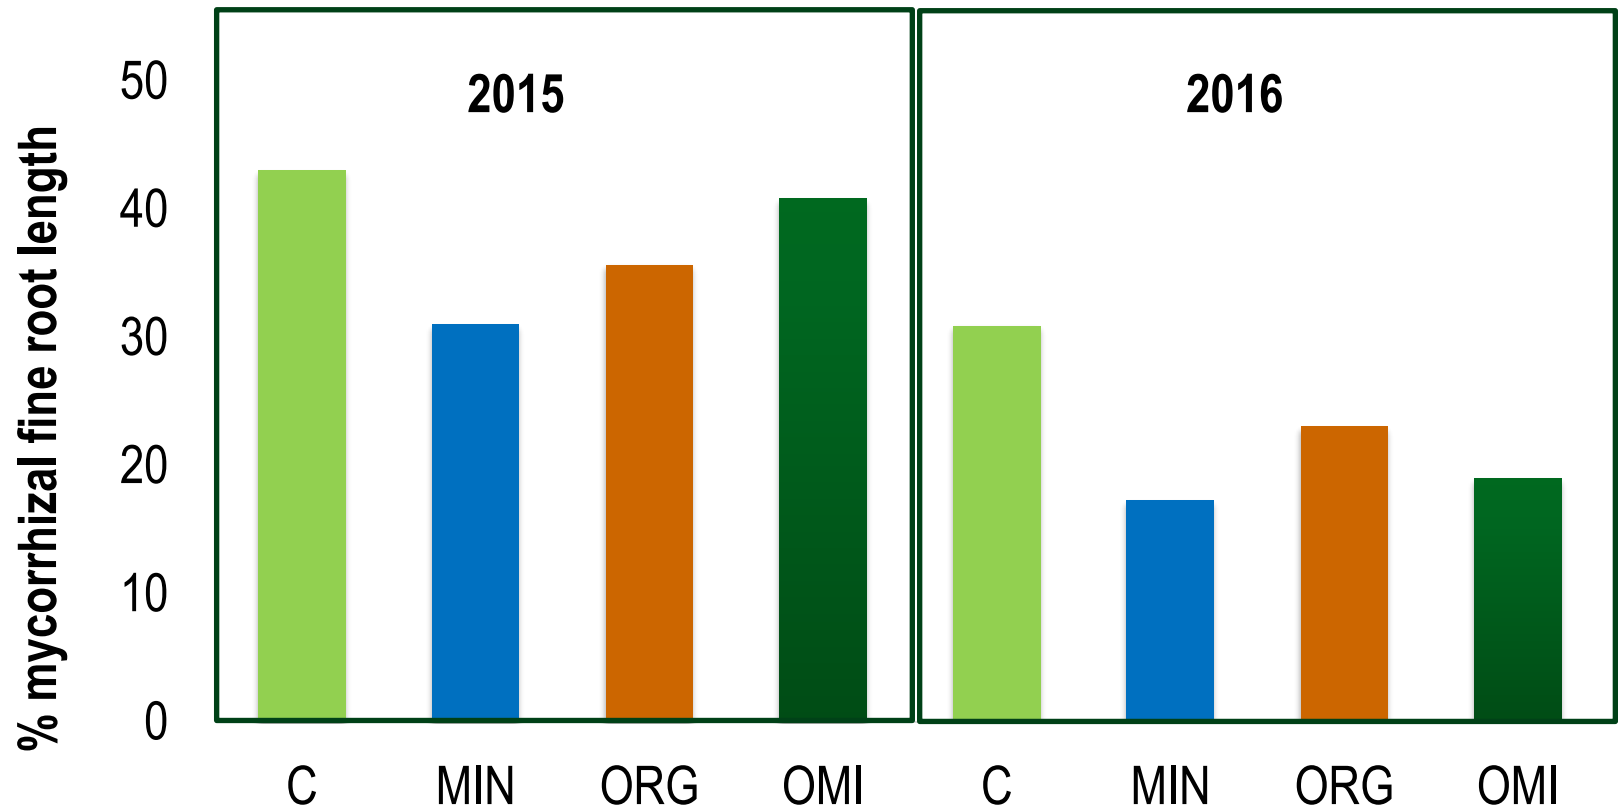

Deja-Sikora et al. (2020)

Significant impacts of the cultivar on mycorrhiza formation

Effects of P fertilization

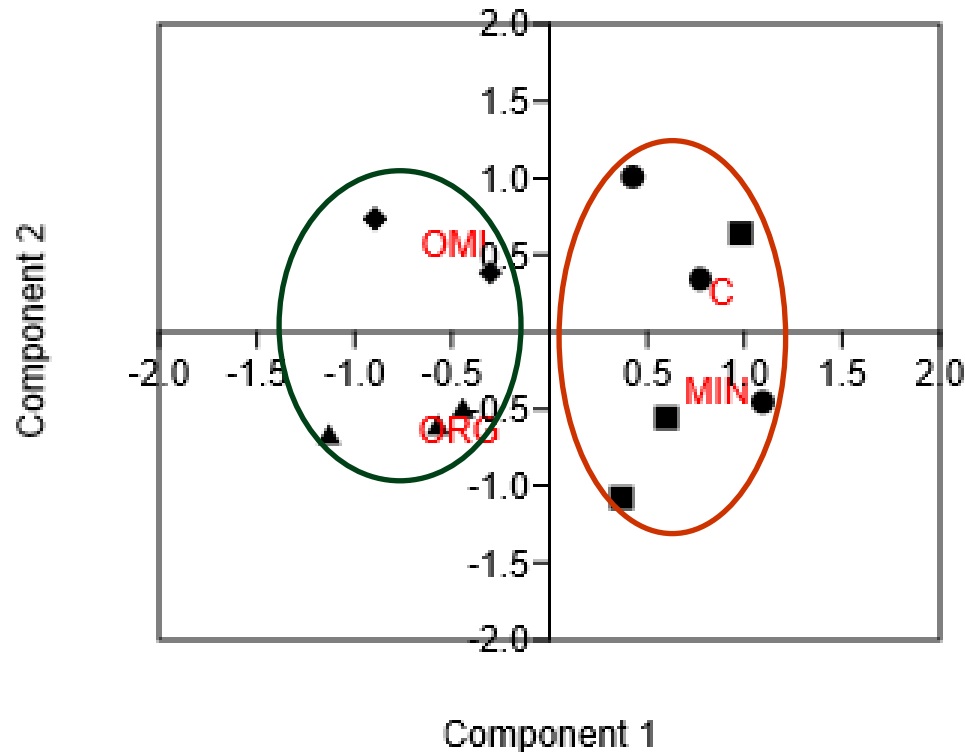

Mycorrhizal fine root length of corn

Peine et al. (2019)

Treatments: C no P fertilization, MIN + TSP, ORG + compost, OMI + TSP and compost

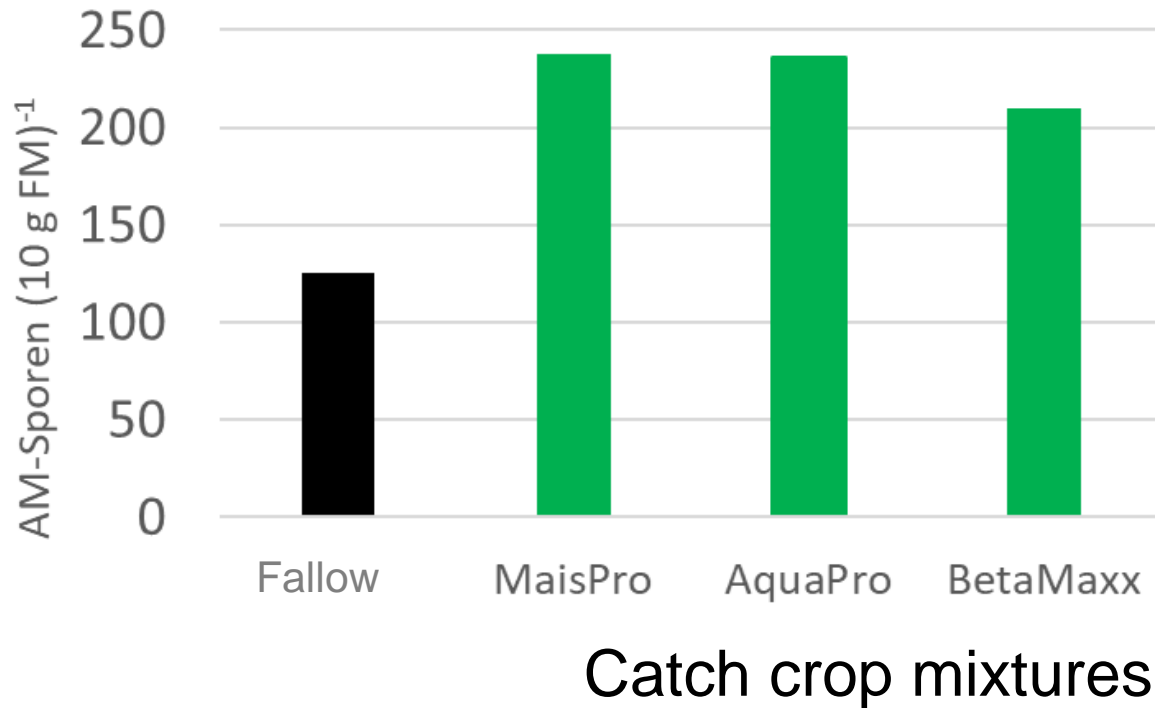

Effects of fertilization

PCA of the genetic fingerprints of AMF under corn at the test site Rostock

Treatments: C no P fertilization, MIN + TSP, ORG + compost, OMI + TSP and compost

Effects of catch crops

up to 100% higher spore density under catch crops compared to a bare fallow

Source: Kaminski, Felgentreu (DSV), 2018

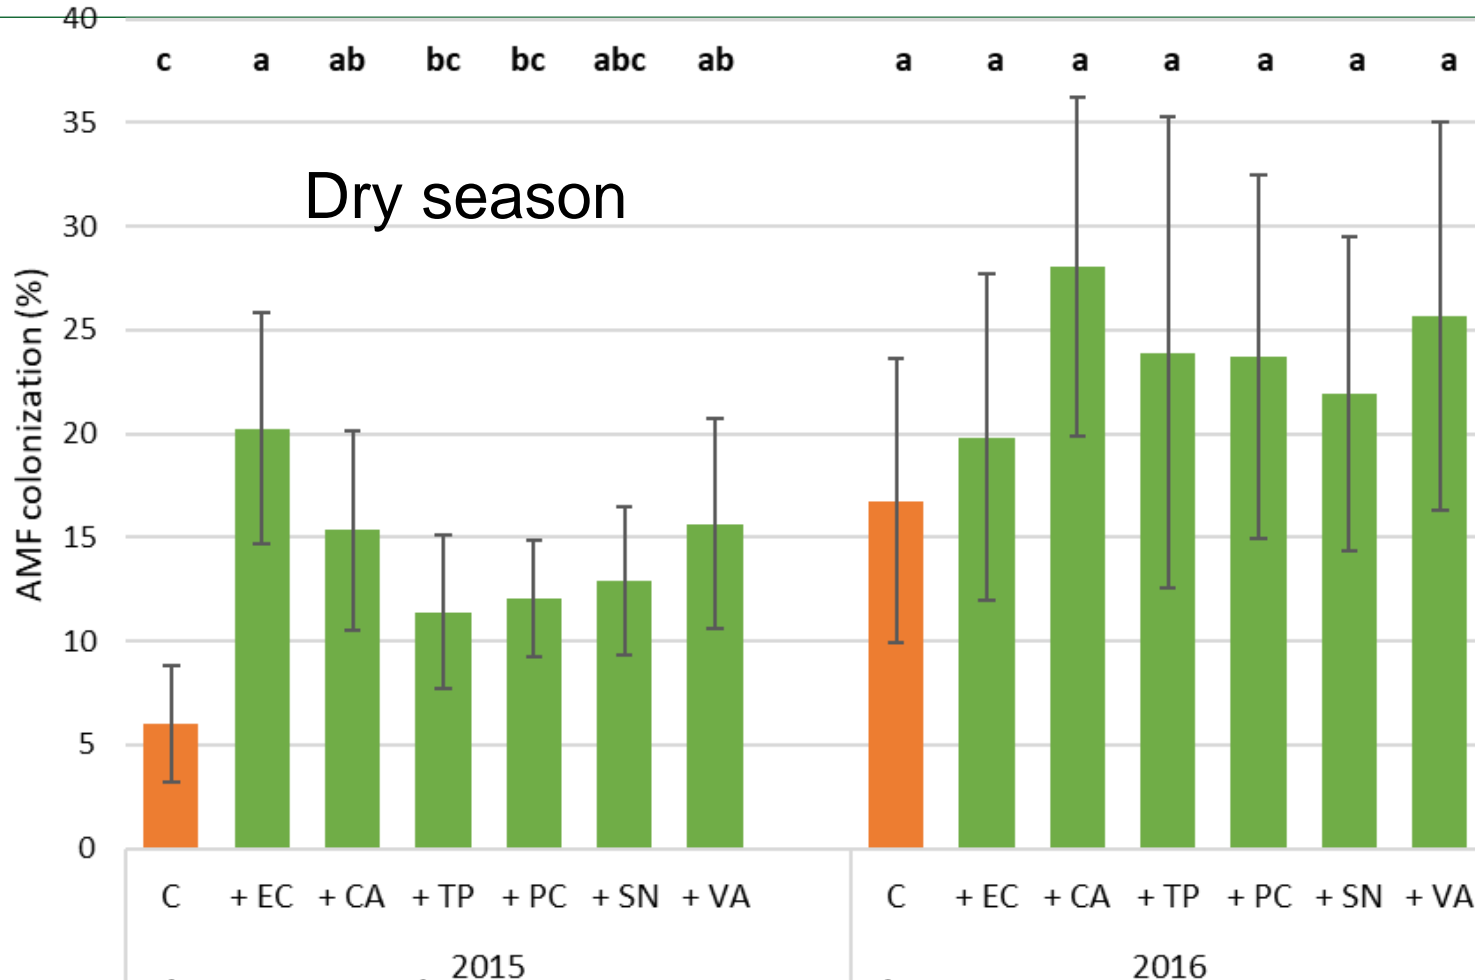

Treatment	Number of taxa	Main components in %	
Bare fallow	-	<i>no vegetation cover</i>	
MaisPro TR	14	38% <i>Pisum</i>	13% <i>Sorghum</i>
AquaPro	8	37% <i>Avena</i>	14% <i>Phacelia</i>
BetaMaxx	7	25% <i>Vicia</i>	24% <i>Pisum</i>

Effects of catch crops

up to 14% higher mycorrhizal colonization of summer barley after seradella cropping, Author: N. Vitow

Effects of weeds

C: control, +CA: maize + *Chenopodium album*, +EC: maize + *Echinochloa crus-galli*, +TP: maize + *Tripleurospermum perforatum*, +SN: maize + *Solanum nigrum*, +PC: maize + *Polygonum convolvulus*, +VA: maize + *Viola arvensis*) Author: A. Zacher

Limitations of mycorrhizal use

Decreased use of mycorrhiza in increased soil P
concentration

Example : soybean
(mod. Plechette & Morel, 1996)

AM – arbuscular mycorrhizal colonization

Application of mycorrhizal inoculum in arable soils

Example: corn in a field experiment
+P
P-fertilization
+M mycorrhiza inoculation

Thielicke, M.; Ahlborn, J.; Eichler-Löbermann, B.; Eulenstein, F. On the Negative Impact of Mycorrhiza Application on Maize Plants (*Zea mays*) Amended with Mineral and Organic Fertilizer. *Microorganisms* 2023, 11, 1663. <https://doi.org/10.3390/microorganisms11071663>

Outlook on other plant growth promoting microorganisms:

Trichoderma

EMZ Uni-Rostock

A

Valerianol

4-Heptanone

Indol-3-acetic acid

3-Octanone

Alpha-Bergamotene

Plant growth-promoting metabolites

Viridine

Harzianum B

biocontrol

Trichodermamide A

Aspergilazine A

B

Guzmán-Guzmán P, et al. *Plants*. 2023; 12(3):432. <https://doi.org/10.3390/plants12030432>

Reasons for failure in the field:

1. Site effects: weather conditions, soil conditions
2. Management effects: fertilization / tillage / variety

Outlook:

Biologicals with direct use of active substances instead of living organisms (e.g. enzymes, phytohormones)
